1. **Publication Title**: Plant Physiology

2. **Publication Number**: 5

3. **Filing Date**: 10/15/04

4. **Board Frequency**

5. **Number of Issues Published Annually**

6. **Annual Subscription Rate**

7. **Complete Mailing Address of Known Office of Publication (Street, city, county, state, and ZIP Code)**

8. **Complete Mailing Address of Headquarters or General Business Office of Publisher (If not printed)**

9. **Complete Mailing Address of Headquarters or General Business Office of Publisher (If not printed)**

10. **Publisher**

11. **Editor**

12. **Managing Editor**

13. **Owner**

14. **Known Bondholders, Mortgagees, and Other Security Holders Owning or Holding 1 Percent or More of Total Amount of Bonds, Mortgages, or Other Securities**

15. **Extent and Nature of Circulation**

16. **Instructions to Publishers**

17. **Signature and Title of Editor, Publisher, Business Manager, or Owner**

**Instructions to Publishers**

1. Complete and file one copy of this form with your postmaster annually on or before October 1. Keep a copy of the completed form for your records.

2. In cases where the stockholder or security holder is a trustee, include in items 10 and 11 the names of the person or corporation for whom the trustee is acting. Also include the names and addresses of individuals who are stockholders who own 1 percent or more of the total amount of bonds, mortgages, or other securities of the publishing corporation.

3. Be sure to file an occupational information return for every year. Free circulation must be shown in items 15, 16, and 17.

4. Item 10: Copies not Distributed, must include (1) newspapers or similar periodicals distributed on Form 564, and (2) return copies not distributed, if any, for the current year.

5. If the publication had Periodical Authorization as a general or regular publication, this Statement of Ownership, Management, and Circulation must be published; it must be printed in any issue in October or, if the publication is not published during October, the first issue printed after October.

6. In item 16, indicate the date of the issue in which this Statement of Ownership will be published.

7. Item 17 must be signed.

**Failure to file or publish a statement of ownership may lead to suspension of Periodical Authorization.**
The LI-6400 is the most referenced photosynthesis system in scientific literature, and for good reason. Used worldwide for plant research, the LI-6400 provides unmatched integration and proven ruggedness and reliability. For more information on the LI-6400, including a product tour, click on www.licor.com/6400.

Data That Speaks Volumes

**Automated Media Preparation: why making media with flasks is obsolete**

There are numerous reasons why modern microbiology laboratories are shifting their media-making operations from traditional manual methods to state-of-the-art, automated methods through the use of specialized equipment. Preparing media manually consists of measuring the appropriate amount of dehydrated culture media (DCM) and water in flasks, heating and stirring the mixture, sterilizing inside an autoclave, then dispensing aseptically into Petri dishes, tubes and/or bottles. This method is labor-intensive and presents several operational uncertainties. Is the media concentration and consistency correct? How can sterilization be insured? Is contamination occurring during the filling stage? Automating this process resolves these uncertainties while providing the added benefits of improved product quality and efficiency.

The Systec MediaPrep system combines stirring, sterilization and pouring into one, precisely controlled process. After adding the desired amount of media and water, the MediaPrep will engage a magnetic stirrer and stir the media for a user defined temperature and time. Temperature and time measurements are recorded through the use of a PT100 temperature probe placed directly in the media. This accurately assesses when the media has reached sterilization temperature. Autoclaving media in flasks is problematic as most autoclaves register the temperature inside the chamber, and not the media. The MediaPrep can also be programmed to hold the sterilized media at a user defined temperature for optimal dispensing conditions.

The Systec MediaPrep can be directly connected to the MediaJet plate pourer, to eliminate risks of secondary contamination during dispensing. The MediaJet is designed to pour directly into deep plate dishes or tubes with a capacity of up to 900 plates per hour and true “walk away” automation. This is an industry first feature with specific applications for plant research. MediaJet features also include a Peltier cooling device which helps minimize plate condensation formation, a UV lamp which extends over the full length of the rotor where the dishes are opened during dispensing, eliminating the possibility of contamination during filling. An optional inkjet printer for labeling/barcoding directly on the sides of dishes is available for complete traceability. Utilization of automated media preparation increases sample throughput, quality of plates, efficiency, reproducibility and productivity.
The PowerPlant™ DNA Isolation Kit provides a novel method for isolating high quality genomic DNA from a variety of plant tissues, such as leaves, roots and seeds. This unique hands-off homogenization uses a bead beating format and allows up to 24 samples to be processed at the same time using either a vortex adapter or a bench top homogenizer such as MO BIO’s Precellys® 24 Homogenizer. Nearly all types of plant tissues can be processed without hand grinding or liquid nitrogen freezing. With this kit’s novel PCR inhibitor removal system, pure genomic DNA can be obtained in less than 60 minutes.
