**Biochemistry & Molecular Biology of Plants**

**Online Image Library!**

ASPB announces the new Online Image Library – containing all images from the best-selling textbook/reference work *Biochemistry & Molecular Biology of Plants*, by Buchanan, Gruissem, and Jones.

The new Online Image Library features images listed by chapter plus the capability to search by individual images. And images are easily imported into PowerPoint for use in presentations.

Access to the site is available for $49.95. ASPB members receive a 20% DISCOUNT, making the purchase price for members $39.95.

To purchase the images from *Biochemistry & Molecular Biology of Plants* using our secure web site, go to http://www.aspb.org/publications/biotext/imagelibrary/. Log in as a member for your member discount. Contact info@aspb.org for more information.

**Plant Sciences Symposium**

**Translational Seed Biology: From Model Systems to Crop Improvement**

An international symposium focusing on the transfer of knowledge of seed biology developed through studies of model systems to improve the agricultural and nutritional value of crops.

**September 17–20, 2007**

University of California, Davis • email sbc@ucdavis.edu

**CALL FOR PAPERS**

**Plant Physiology Focus Issue on Plant Interactions with Arthropod Herbivores**

*Plant Physiology* is pleased to announce a Focus Issue on Plant Interactions with Arthropod Herbivores to be published in March 2008. The issue will be edited by Georg Jander and Gregg Howe. Submissions describing novel aspects of any interaction between plants and arthropod herbivores are welcome. Emphasis should be on molecular and biochemical aspects of the interaction, including recognition of herbivory, signaling pathways that regulate host plant defense, volatile signals, tritrophic interactions, plant defense chemistry, manipulation of plant defenses by herbivores, and natural variation in plant resistance to herbivores.

Authors interested in contributing should indicate this in the cover letter when submitting papers online at [http://submit.plantphysiol.org/](http://submit.plantphysiol.org/). Please select “Plant-Herbivore Interactions, March 2008” from the Focus Issue list in the online submission system. Articles published within 2 years before and after the Focus Issue will be considered for inclusion in an online Focus Collection of articles relevant to the focus topic.

Please contact Georg Jander (gj32@cornell.edu) or Gregg Howe (howeg@msu.edu) for additional information.

**Deadline for Submissions:** November 1, 2007.

To submit an article, please go to [http://submit.plantphysiol.org/](http://submit.plantphysiol.org/).
Free online color will be available for all papers submitted to *Plant Physiology* starting October 1, 2006. This new feature allows you to have figures appear in color in the online version of your article but in black and white in the print version, when the color will add value to your image but is not necessary for interpretation of the data.
LI-COR’s LI-6400 leads the way as the premiere portable photosynthesis system. Continuously developed and enhanced since 1995 to meet demanding research needs, LI-6400 design firsts include –

- IRGAs in the sensor head
- User cleanable optics
- Leaf chamber fluorometer
- Red/blue LED light source
- Remote Internet access NEW!
- Customer training program
- Real-time graphics
- Auto programs
- Multiple chamber options

The most referenced photosynthesis system in the world.

See the LI-6400 on the Web at www.licor.com/6400

Pour 60mm & 90mm plates with COMBIJET!

TECHNOLOGY

The Systec MediaPrep and COMBIJET plate pourer combine stirring, sterilization and pouring into one, precisely controlled process. After adding the desired amount of media and water, the MediaPrep will engage a magnetic stirrer and sterilize for a user-defined temperature and time. These measurements are recorded through the use of a PT 100 temperature probe placed directly in the media. This accurately assesses when the media has reached sterilization temperature.

The Systec MediaPrep can be directly connected to the COMBIJET plate pourer, to eliminate the risk of secondary contamination during dispensing. The COMBIJET is designed to pour directly into any depth plate, or tubes. This is an industry first feature with specific applications for plant research.

Innovations include manual and automatic pouring options, with real-time monitoring of plate pourers and automatic adjustments as needed to ensure consistent quality.

An optional inkjet printer for labeling/barcoding directly on the sides of dishes is available.

PERFORMANCE

The Systec MediaPrep is available in a range of sizes from 10L-120L capacities. Media can be prepared and sterilized in 60-90 minutes. The MediaPrep can also be programmed to hold the media at a user defined temperature for optimal dispensing conditions. When connected directly to the COMBIJET plate pourer, true “walk-away” automation for media preparation and dispensing is achieved. The COMBIJET plate pourer can pour up to 900 plates per hour, and with the TUBEFILLER option, can be converted to an automatic tube filler. One system, two applications!

SUPPORT

Utilization of automated media preparation increases sample throughput, quality of plates/tubes, efficiency, reproducibility and productivity. Microbiology International is committed to providing customers with a complete laboratory solution; including on-going customer service and support.

Plant DNA and RNA Isolation Kits

Please come and visit us at Plant Biology and Botany 2007 in Chicago | Booth 702

The PowerPlant™ DNA Isolation Kit has been successfully utilized on a wide variety of plant types including leaf, roots, and seed samples. Works well for difficult plants such as pine needles, grapes, cotton, sunflower, and strawberry. The PowerPlant™ DNA Isolation Kit provides special clean-up reagents to assure PCR success among even the most challenging plant samples rich in polyphenols and polysaccharides.

The UltraClean-htp™ 96 Well Plant DNA Isolation Kit provides high-throughput isolation of high-quality DNA from 96 samples in less than 3 hours. The simple 96 well procedure provides highly reproducible yields of total cellular DNA. The streamlined procedure and convenient 96 well format eliminate tedious pipetting and DNA re-suspension steps, and helps minimize cross-contamination. Polysaccharides, proteins and enzyme inhibitors are efficiently removed, making the purified DNA suitable for use in all PCR and downstream applications.

The UltraClean™ Plant RNA Isolation Kit is designed to isolate total RNA from a wide variety of plant materials. Sample sizes from 5 to 100 mg can be processed. All contaminants, such as polysaccharides, are removed, and the eluted RNA is ready for all downstream applications.
