**Supplementary Figure S5. Additional members of DEFL subgroups CRP0570 and CRP0830 are downregulated in *A. halleri* Fusarium infected pistils.**

In both *A. halleri* and *A. thaliana* a conserver group of DEFLs, mostly from subgroups CRP0570 and CRP0830 are downregulated in pistils both during *Fusarium* infection and pollination. In the case of *A. halleri*, additional members of these subgroups are downregulated only during *Fusarium* infection, as indicated in this bar chart. Several of these genes are closely related to those downregulated in both conditions in *A. thaliana* (Figure 6). To facilitate identifying these relationships, in the legend of this bar chart we employed the annotation of the corresponding *A. thaliana* genes to designate *A. halleri* orthologs.
